1. Introduction:

The Laptop Request Catalog Item project is designed to automate and streamline the process of requesting laptops within an organization. The system allows employees to submit laptop requests through a centralized service portal, while managers and IT teams can review, approve, and fulfill requests efficiently. The solution is implemented using the IT Service Management platform ServiceNow.

2. Project Objective:

- To create a standardized laptop request process
- To automate approval workflows

- To reduce manual effort for IT teams
- To improve request tracking and transparency
- To enhance user experience for employees

3. Problem Statement:

In many organizations, laptop requests are handled manually through emails or spreadsheets, which leads to approval delays, lack of tracking visibility, miscommunication between departments, and inefficient asset allocation. A centralized automated system is required to solve these issues.

4. Scope of the Project:

The project includes laptop request catalog item creation, approval workflow automation, task assignment to IT team, notifications and tracking, and request status monitoring. Procurement system integration is considered a future enhancement.

5. System Requirements:

Hardware Requirements:

- Computer/Laptop with internet connection
- Minimum 4 GB RAM

Software Requirements:

- Web browser (Chrome/Edge/Firefox)
- ServiceNow Instance
- Operating System: Windows/Linux/Mac

6. Methodology:

The project follows the Service Catalog Development Lifecycle:

1. Ideation Phase
2. Design Phase
3. Development Phase
4. Testing Phase
5. Deployment Phase

7. Ideation Phase:

The team conducted brainstorming sessions to identify challenges in the laptop request process and generated possible solutions. Key outcomes included the need for a standardized request form, automated approval workflow, inventory validation, and notification system.

8. Design Phase:

Catalog Item Fields:

1. Employee Name (Auto-filled)

2. Employee ID
3. Department
4. Laptop Type (Standard / High Performance)
5. RAM Requirement
6. Storage Requirement
7. Purpose / Justification
8. Required Date

Workflow Steps:

1. Request Submission
2. Manager Approval
3. IT Approval
4. Task Creation for IT Team
5. Laptop Allocation
6. Request Closure

9. System Architecture:

The system architecture consists of User Portal (Frontend Interface), Service Catalog Module, Workflow Engine, Notification System, Task Management Module, and Database (Request Records).

10. Development Phase:

Steps followed:

1. Created Catalog Item

2. Added Variables (form fields)
3. Designed Workflow/Flow Designer
4. Configured Approvals
5. Created Fulfillment Tasks
6. Configured Notifications
7. Tested End-to-End Process

11. Workflow Process:

Step-by-Step Flow:

1. User submits laptop request
2. Request goes to Reporting Manager for approval
3. After approval, IT team receives task
4. IT team allocates laptop
5. Request marked as completed
6. User receives confirmation notification

12. Testing Phase:

Testing Types:

1. Unit Testing
2. Integration Testing
3. User Acceptance Testing (UAT)

Sample Test Cases:

1. Submit Request → Request created successfully
2. Manager Approval → Approval notification sent
3. IT Task Creation → Task assigned to IT team
4. Completion → User notified

13. Results and Outcomes:

The implemented system achieved faster request processing, reduced manual work, improved transparency, better communication between teams, and efficient asset allocation.

14. Advantages of the System:

1. Automation reduces human errors
2. Centralized request tracking
3. Improved employee satisfaction
4. Time-saving for IT department
5. Scalable for other asset requests

15. Future Enhancements:

1. Integration with Asset Management Database
2. Procurement system integration
3. Mobile application access
4. AI-based laptop recommendations
5. Real-time inventory tracking

16. Conclusion:

The Laptop Request Catalog Item project demonstrates how workflow automation improves IT service delivery. A structured and automated request system increases efficiency, transparency, and user satisfaction.
